

Problems with your Expansion Joints?

FIX IT with JOINT SYSTEMS

Expansion Joints in Stadiums, Shopping Centres, Car Parks are notorious for having poor expansion joints. Due to the often irregular shape of the structure, movement occurs in many different directions. This is generally where expansion joint products fail.

ITS ALL IN THE PREP

As with many things in life, preparation is key and expansion joint design and installation is no exception. The condition of the joint prior to installation, regardless of if it is a new expansion joint or when replacing an old joint, must be clean from dirt and debris. It must also be dry, unless otherwise stated. In some cases, especially whilst installing on concrete, steel or plastic substrates, there may be chemical treatments which require primers or other surfactants to be applied. This is why you need an expert in Chemical Bonding. JOINT SYSTEMS is what you need.

CONSTRUCTION EXPERTISE

Stadium expansion joints are notorious for failure. This is due to the irregular 'round' shape of the Stadium bowl.
